Introduction

Intro

InSight Reporting is designed to bring together data from the Xenegrade system so that staff can build meaningful reports and dashboards. The reporting database contains dozens of datasources grouped into functional categories (e.g., courses, clients, finances). Each datasource exposes a set of fields from the underlying system tables, along with primary keys that allow the tables to be joined together.

Purpose of this document

The purpose of this document is to describe the available datasources and fields in the reporting database. It serves as a reference for report writers who need to understand the structure of the data model. By summarizing each datasource and highlighting the primary keys, this guide helps users determine which tables to use and how to join them when designing queries.

Error clause

While every effort has been made to ensure the accuracy of the information in this document, the datasources and fields may change as the software evolves. Field names, data types, and available datasources could be updated in future releases. Users should consult the latest documentation or contact support if they encounter discrepancies. Xenegrade Corp. assumes no liability for errors or omissions, and the information is provided “as-is.”

Custom datasources

This document describes only the standard (built-in) datasources provided by the reporting system. Any custom tables or datasources created specifically for your organization are not included here. If you have custom datasources, please refer to your internal documentation or contact your system administrator for details.

Datasource Categories

The reporting database organizes datasources into categories based on their function. Below are descriptions of each category. For a detailed breakdown of each datasource within these categories, see the summaries section of this document.

Category	Description
Aggregate	The Aggregate category contains datasources that pre-compute totals, counts, and other summarized metrics. These datasources bring together information from multiple transactional tables—such as attendance, invoices, or assignments—to provide consolidated statistics. They are useful for dashboards and high-level reports because they avoid the need to calculate totals at runtime. Useful for dashboards and high-level reporting. • Number of datasources: 19 • Example datasources: – AggregateClientAttendance summarizes attendance metrics for clients (e.g., absent days, attended hours). – AggregateInvoiceItemsByInvoice totals invoice line items by invoice. – AssignmentCounts counts the number of assignments per course or client. • Fields and keys: Aggregate datasources usually include numeric fields such as AbsentHoursDaily, AttendedHoursAssignment, or TransactionCount. The primary keys typically mirror the underlying fact tables (e.g., cliID for client, schID for course section) so that aggregated records can be joined back to detailed records if needed. • How to use: Use Aggregate datasources when you need pre-summarized figures. They are ideal for summary reports (e.g., total revenue by month) and for connecting to charts or dashboards where counts and totals are required without complicated SQL.
Branch	The Branch category stores information about the organization and its locations. There is a single datasource in this category, called Organization, that lists all branches and their identifying details. Each branch record includes addresses, contact information, and settings that control how the organization interacts with the system. • Number of datasources: 6 • Fields and keys: The tables contains around fields such as OrgName, BranchID, Address1, City, State, and ZipCode. The primary keys are orgID and zipID. These identifiers allow the

Category	Description
	Organization datasource to be linked to client, course, or invoice records that include branch information. • How to use: Join Branch or BranchMulti to other datasources via BranchID to retrieve branch-level details (e.g., branch name or contact phone number). This is helpful for grouping reports by location or for filtering data to a specific branch. Use BranchMulti to allow reports to display data cross all Branches in a multi-Branch site.
Clients	The Clients category is the largest, with 50 datasources covering client profiles, program enrollments, performance statistics, and attendance details. These datasources store core information about students or participants, including demographic data, assignments to courses, attendance records, and statuses. • Number of datasources: 50 • Example datasources: – Clients – the primary client profile table containing demographic and contact fields (e.g., ClientID, FirstName, LastName, DateOfBirth). – Assignments – lists clients’ course assignments and related status codes. – ClientAttendance – stores attendance records for each client per session. – IntakeAssessment and Performance – hold assessment scores and performance data. • Fields and keys: Common key fields include cliID (client ID), assID (assignment ID), schID (course section ID), and csgID (client status group ID). Many datasources also use BranchID to link to the branch where the client is registered. Primary key fields marked with a Y in the source document uniquely identify each record and are essential when joining client-related datasources together. • How to use: When building reports about individuals, use datasources in this category. For example, to list client demographics with their attendance history, join the Clients datasource to ClientAttendance on cliID and to Organization on BranchID. Use Assignments or ClientStatus datasources to filter clients by enrollment or status.
Companies	The Companies category contains data about companies or sponsors associated with clients or courses. It is designed for programs that involve corporate clients or employers who sponsor participants. Datasources record company details, contacts, addresses, and relationships to clients and invoices. • Number of datasources: 10 • Example datasources:

Category	Description
	– Companies – the main table for company profiles, including fields like CompanyID, CompanyName, Phone, and Email. – CompanyContacts – lists individuals who act as contacts for a company. – CompanyInvoices – summarizes invoices billed to a company. • Fields and keys: The primary keys include CompanyID and spoID (sponsor ID). Other fields capture addresses (Address1, City, State), communication details (Phone, Fax), and business classifications. These tables also reference BranchID for branch linkage and cliID when a client is tied to a corporate sponsor. • How to use: Use these datasources when producing reports about employer-sponsored clients or corporate revenue. Join Companies with Invoices or CompanyInvoices on CompanyID to analyze financial transactions, or join to Clients via sponsor relationships to see which individuals are supported by each company.
Courses/Sections	The Courses/Sections category deals with the instructional side of the system. It contains information about courses, course bundles, schedules, and section-specific details. Datasources in this category help you track curriculum structure, enrollment limits, costs, and scheduling data. • Number of datasources: 39 • Example datasources: – Courses – lists course offerings including course code, title, description, and standard hours. – Sections – describes individual offerings of a course, with fields like SectionID, StartDate, EndDate, and instructor assignments. – Bundles – groups courses into bundled offerings. – CourseFees – details pricing and fee structures for courses or sections. • Fields and keys: Key fields include couID (course ID), CourseID, schID (section ID), disID (discount ID), and BranchID. Primary keys vary by datasource but often combine BranchID and an ID field such as couID or SectionID. Additional fields cover meeting dates, locations, maximum enrollment, and fee amounts. • How to use: When you need information about classes or schedules, look here. To build a class roster, join Sections with Assignments (from the Clients category) on schID. To calculate revenue by course, join CourseFees or SectionFees with financial datasources on schID and couID.
Financial	The Financial category tracks monetary transactions such as invoices, payments, fees, and revenue accruals. These datasources support both

Category	Description
	student-funded and sponsor-funded payment models. They are critical for financial reporting, accounts receivable analysis, and auditing. • Number of datasources: 23 • Example datasources: – AccrualRevenue – records revenue recognized over time, storing fields like cliid (client ID), invid (invoice ID), and schid (section ID). – AgedReceivables – lists outstanding invoice balances by age bucket. – Invoices and InvoiceItems – capture invoice header and line-item details. – Transactions – logs payments, refunds, and adjustments. • Fields and keys: Primary keys include invID (invoice ID), itmID (invoice item ID), BranchID, and schID. Monetary fields include AmountDue, AmountPaid, TaxAmount, and DiscountAmount. Dates (e.g., InvoiceDate, DueDate) and statuses help track outstanding balances and payment histories. • How to use: These datasources form the backbone of financial reporting. Use AgedReceivables to monitor overdue payments, AccrualRevenue to recognize revenue across fiscal periods, and Transactions to reconcile payments. Join financial tables with client or course tables (via cliID, schID, and BranchID) to see who paid for what and when.
Staff	The Staff category covers employees who teach or support courses. It holds staff profiles, assignments to sections, and payroll rates. This category is smaller but vital for understanding instructor workload and compensation. • Number of datasources: 7 • Example datasources: – Staff – the central staff profile table, storing EmployeeID, names, addresses, contact details, hire date, and role. – StaffSections – links staff members to course sections, indicating which instructors are teaching each class. – StaffPayrollRates – captures pay rates and compensation arrangements. • Fields and keys: The primary key across most tables is EmployeeID. Additional keys include SectionID or schID (for section assignments) and BranchID. Fields detail certification status, job titles, and employment status (active/inactive). • How to use: When generating instructor or payroll reports, join Staff to StaffSections or StaffPayrollRates on EmployeeID. Combine with Sections (Courses/Sections category) to see when and where each instructor is teaching. Add financial datasources if you need to compute compensation based on classes taught.

Category	Description
System	The System category contains configuration tables and lookup lists that support the entire application. These datasources define constants (e.g., attendance codes, funding sources, zip codes) and track system-level activities (e.g., login history). They are often referenced as foreign keys in other categories. • Number of datasources: 71 • Example datasources: – Accounts – defines system user accounts and security roles. – AttendanceExcusedTypes – lists codes used to mark excused absences. – CalendarHolidays – lists holidays that affect scheduling and attendance calculations. – ZipCodes and Countries – provide postal code and country lookup data for address fields. • Fields and keys: Because these are lookup or configuration tables, the primary keys vary but often include an ID (e.g., accID, excusedID, ZipID) and a BranchID when the value is branch-specific. Fields typically store descriptions, status flags, and sort orders. • How to use: Join System datasources to translate codes into human-readable names. For instance, join AttendanceExcusedTypes to ClientAttendance on excusedID to display the reason for an excused absence. Use ZipCodes when you need city/state names based on a zip code in the Clients or Companies categories. Many datasources in other categories reference System tables for lookups; ensure you include the correct keys in your joins.

Primary Keys and Datasource Joins

Common keys

Primary keys uniquely identify records within a datasource. They are marked with a “Y” in the Key column of the field lists. Common primary keys include:

- **cliID** – unique identifier for a client; used across assignments, attendance, financial tables, and more.
- **assID** – assignment ID; links a client to a course section.
- **schID** – section ID; identifies a specific offering of a course.
- **couID / CourseID** – course identifier; distinguishes different courses.
- **invID** – invoice ID; used to join invoices to invoice items and payments.
- **itmID** – invoice item ID; identifies a line item within an invoice.
- **EmployeeID** – primary key for staff records.
- **BranchID** – identifies the branch or location; used extensively for filtering and joining.

Joins and best practices

When building a report, you typically join datasources on their primary keys and corresponding foreign keys. A few guidelines:

1. **Match on primary keys:** Always join a datasource’s primary key to the related foreign key in another table. For example, join `Clients.cliID` to `ClientAttendance.cliID` to pull attendance records for each client.
2. **Include branch keys when applicable:** Many datasources include a `BranchID` field to distinguish records by branch. When joining tables, include `BranchID` in the join to avoid mixing data from different branches.
3. **Use section and course IDs for academic data:** To connect course or section data, join `couID` or `CourseID` from the `Courses` datasource to `CourseFees` or `Bundles`, and join `schID` from `Sections` to attendance or financial tables.
4. **Link financial data by invoice IDs:** To see invoice details and payments, join `Invoices.invID` to `InvoiceItems.invID` and `Transactions.invID`.
5. **Combine multiple joins for complex reports:** For example, to build a roster with payment status: join `Clients` (via `cliID`) to `Assignments` (via `cliID` and `schID`), then join to `Sections` (via `schID`), and finally to `Invoices` (via `cliID` and `schID`).

Common join examples

Scenario	Recommended join keys
Client demographics and attendance	<code>Clients.cliID</code> → <code>ClientAttendance.cliID</code> (and include <code>BranchID</code> if filtering by branch)
Course roster with instructor	<code>Assignments.schID</code> → <code>Sections.schID</code> ; <code>Sections.schID</code> → <code>StaffSections.schID</code> ; <code>StaffSections.EmployeeID</code> → <code>Staff.EmployeeID</code>

Scenario	Recommended join keys
Invoice detail with payments	Invoices.invID → InvoiceItems.invID; Invoices.invID → Transactions.invID
Revenue by course section	AccrualRevenue.schID → Sections.schID; optionally join Courses.couID for course names

When designing joins, ensure that the keys you use exist in both tables and are meant to relate those tables. If a datasource includes more than one primary key (e.g., composite keys), all components must be used in the join.

Datasources and Fields

Category: Aggregate

Datasource: AggregateClientAttendance

Field	SQLType	DataType	Key	Notes
